

biomass gasification pyrolysis and pdf

Gasification is a process that converts organic- or fossil fuel-based carbonaceous materials into carbon monoxide, hydrogen and carbon dioxide. This is achieved by reacting the material at high temperatures (>700 °C), without combustion, with a controlled amount of oxygen and/or steam. The resulting gas mixture is called syngas (from synthesis gas) or producer gas and is itself a fuel.

Pyrolysis is the thermal decomposition of materials at elevated temperatures in an inert atmosphere. It involves the change of chemical composition and is irreversible. The word is coined from the Greek-derived elements pyro "fire" and lysis "separating".. Pyrolysis is most commonly used to the treatment of organic materials. It is one of the processes involved in charring wood.

The primary function of the carbonaceous materials is to act as a reductant, i.e., to react with the metal oxide and to form carbon monoxide. They are also a source of carbon in Fe-Mn and Fe-Cr alloys.
